Routine: main

Data, Variables, and Effects:

input: data presented as a function $f(p,q)$,
giving the function value at the
point $(p-iq)/(p+iq)$

output: array of complex Fourier coefficients
effect: calculates Fourier transform

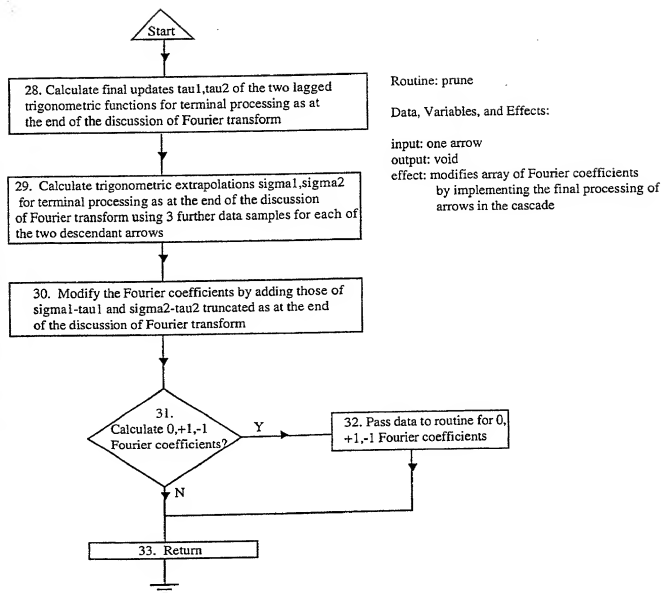

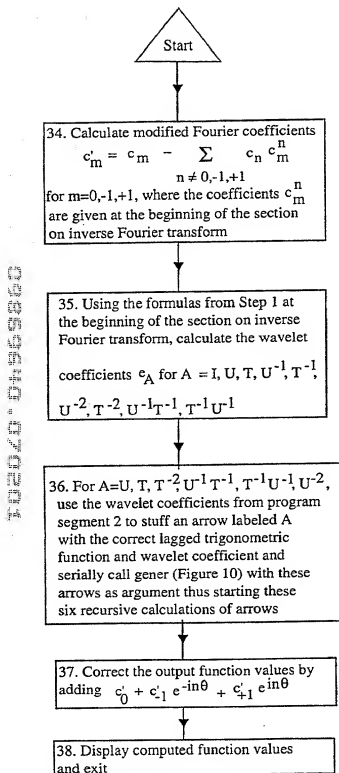

FIGURE 8

9/10

Routine: main

Data, Variables, Effects:

input: array of complex Fourier coefficients
 c for $|n| \leq N$

output: array of three-tuples (p, q, z) , where
 output function takes complex value
 z at $(p-iq)/(p+iq)$ given in the counter-
 clockwise order on the circle

effect: calculates inverse Fourier transform
